ANGELA D. SYKES

SUPERVISORY PATENT EXAMINER

Continuation of 11. does NOT place the application in condition for allowance because: For Applicant's convenience Examiner specifically points out the rejections of claims 15-35; however, the limitations have always been present in the art of record. In regards to claim 15, Alt discloses an implantable cardiac device that promotes intrinsic rhythm by increasing the pacing rate to compensate for orthostasis phenomenon when a patient transitions from a comparatively less upright posture to a comparatively more upright posture (col. 7 lines 10-15), which thus Examiner maintains the position that the Alt reference teaches of a implantable cardiac device that comprises circuitry to sense whether a patient is in intrinsic rhythm when transitioning from a less upright posture to a more upright posture. Further in regards to claim 15, although Alt does not specifically teach of a processor for detecting whether or not the patient is in intrinsic rhythm, Examiner takes the position that it would have been obvious to one having ordinary skill in the art at the time of the invention to modify the system as taught by Alt to include such limitations as taught by Pitts Crick et al. Pitts Crick et al. teaches of a implantable cardiac device that comprises a processor that has the ability to enable or disable increased pacing as deemed necessary (see for example col. 4 lines 13-16). Examiner maintains the position that it is well known in the art for pacing systems to comprise processors that adjust (enabling and/or disabling) pacing rates as deemed necessary to meet a patient's needs, as taught by Pitts Crick et al., and thus it would have been obvious to one having ordinary skill in the art at the time of the invention to modify the system as taught by Alt to include a processor which is enables and disables increased pacing as deemed necessary when the patient transitions from a less upright posture to a more upright posture, since this would provide more efficient therapy and energy conservation. Examiner also notes that although Alt does not specifically state that the increased pacing rate is to achieve a more natural vasoconstrictive response, it does appear that such an outcome is inherent in the system, since the pacing of the Alt system appears to be similar to that of the claimed invention. Further, Applicant has not incorporated such limitations in claim 15. Similarly, independent claims 20, 25, 27 and 32, present similar limitations as to claim 15, and stand rejected for similar reasons. Further, dependent claims 16-19, 21-24, 26, 28-31 and 33-35, stand rejected for the reasons as set forth in the previous Office Action of April 6, 2006.
